

```

> n <- 100

> a <- rnorm(n)

> mu <- mean(a)

> sd <- sd(a)

```

The coefficient estimate of *PCT_UNC* is -0.318441144485461 and significant at the *XXX*% level, indicating that the *XXX* relation between business uncertainty and investment holds even after controlling for a large variety of other possible drivers of investment. This relationship is also economically meaningful: an increase in business uncertainty from the first to the ninth decile is associated, *ceteris paribus*, with a *XXX* in investment by around *XXX*%.

The coefficient estimate of *NUM_UNC* is *XXX* and significant at the *XXX*% level, indicating that the *XXX* relation between business uncertainty and investment holds even after controlling for a large variety of other possible drivers of investment. This relationship is also economically meaningful: an increase in business uncertainty from the first to the ninth decile is associated, *ceteris paribus*, with a *XXX* in investment by around *XXX*%.
